

How to Configure Your Blog's Post List Page

Introduction

The **Post list page** is your blog's archive: it shows published posts as cards with images, titles, and excerpts. On systeme.io, you configure how many posts appear, layout style, spacing, and card design—without touching code. This page is **required** and cannot be deleted.

This guide expands [How to configure your blog's post list page](#).

What You Need

- A [systeme.io](#) account ([plan](#))
- An existing blog ([create a blog](#))
- At least one published [blog post](#) to preview listings

Step 1: Open the Post List Page Editor

Accessing the blog's post list page:

1. Go to **Blogs** on the **Sites** tab
2. Click your **blog's name**
3. Click **Pages** to review blog pages
4. Locate **Post list page**
5. Click the **three dots** → **Edit**

The page opens inside your [blog layout](#) (header/footer from Blog Layout; listing lives in the page body).

Step 2: Blog Post Listing Options

Click the **blog post listing** element on the page, or use the left settings panel. You can modify:

Blog post listing

- **Number of posts per page** — pagination size
- **Vertical spacing** — gap between rows/cards

Post listing settings

- **Post listing layout** — choose the layout preset for the grid/list

Post card settings

- **Blog post image position** — where the cover image sits on each card
- **Background colors, shadow, style, and padding** — card chrome
- **Image** — treatment on the card thumbnail

Information shown on each card comes from post metadata (title, short description, image, categories) defined when you [create posts](#).

Latest Blog Posts (Home or Other Pages)

Besides the full **Post list page**, you can add a **Latest blog posts** element on Home or custom [blog pages](#). From its settings:

- **Number of posts to display**
- **Vertical space**
- **Horizontal display** — row/carousel-style teasers
- **Image** — shadows, corner radius, margin

Use this for a homepage teaser; keep the Post list page for the full archive on [systeme.io](#).

Step 3: Save and Preview

1. **Save changes** in the page editor
2. **View blog** and open the post list URL
3. Confirm pagination, card layout, and mobile wrapping

Categories and Archives

Category archives ([blog categories](#)) use their own URLs; post list page shows **all** posts. Align menu links so “Blog” or “Posts” points to this page ([blog menu](#)).

Troubleshooting

Listing empty

No published posts or wrong blog selected.

Cards look uneven

Mix of missing cover images—require images on posts; adjust image position.

Too many posts on one screen

Lower **posts per page**; check you edited Post list page, not only Latest blog posts widget.

[Contact systeme.io support](#) with blog URL.

Frequently Asked Questions

Can I delete the Post list page?

No—mandatory blog page; edit design only.

What does posts per page control?

Cards per page before pagination on the main listing.

What is the Latest blog posts element?

Smaller teaser block for Home or other pages.
